The structure is built to be used without a safety line in Spring, Summer and Fall.

Only lifejacket, helmet and wetsuit for water below 18°C.

The structure is also built to be used with a safety line

Double function on the same construction.

When winter kills your fingers and it's not pleasant to fall into the water, the continuous belay system keeps you safe and secure when falling.

FLOATING HIGH ROPE ADVENTURE

New in 2021
Nieuw in 2021
Nouveau en 2021
Neu in 2021

- The floating high rope adventure is a completely new attraction on the international market that can't be missed in any adventure park with a lake or waterfront.
- A challenging activity with obstacles that make "falling" possible. 😬
- It is not a Ninja run. 😬
- It is a challenge to overcome the obstacles without falling.
- The level of difficulty of the obstacle is therefore "not" extra high. You don't have to be a super being to overcome obstacles.
- Pieces are simply missing in the obstacles, which means that you just needs a little bit of a balance..... to go on.
- No balance is a wet suit or is dangling on the lifeline 😬

INSPIRATION TO DEVELOP YOUR FLOATING HIGH ROPE ADVENTURE

- The following is an overview with indicative prices for a number of possible standard concepts. Of course more concepts are possible.
- The basis of each structure is a triangle or a multiple of triangles.
- A certain number of obstacles have been included in these concepts.
- In the concept with no lifeline, the adventure can be experienced in any direction. Several adventurers can also try to overcome an obstacle, either helping or annoying each other.
- In the concept with a lifeline, depending of the type (Saferoller or speedrunner) the possibilities are determined by the life line.
- Certain concepts can be made much more expensive or cheaper. Everything is determined by the cost of the obstacles.
- Also the prices of the obstacles themselves can vary from 250,00 € to 6500,00 € each. A basic package can also be built with a limited number of obstacles, so that at a later stage it will be full of obstacles.
- For reasons of stability and therefore sustainability, the concepts are always based on triangles. The strength of the structure lies in the roof section to avoid accidents by falling down on structures below water.
- Proposals by the customers themselves, concerning the construction of certain shapes in triangles, are always welcome. After all, it is the customer himself who is looking for a solution to fill in a certain zone, and this with a certain look and feel in the park.
- In a later phase, this concept is infinitely expandable in 6 directions, always in a triangular context.
